Sadaf Siddiqui – Cover Letter (AI / Gen AI / Full-Stack AI Engineer)

Oct 30, 2026 · @sadafcc

Cover letter

Dear Hiring Manager,

I am a Senior AI Engineer with more than 10 years of full-stack development experience. For the past two years, I have specialized in taking generative AI from prototype to production: designing RAG pipelines and LLM agents, deploying them on serverless cloud infrastructure, and building the web interfaces people use every day. I am excited to apply for this role, because my experience aligns closely with your team's needs and I am confident I can make a meaningful contribution from day one.

I currently work at Code Connect on Scout, an AI assistant for Studies Weekly Online, a K-12 curriculum platform. I work across the whole stack: LangGraph agent orchestration on Amazon Bedrock (Nova Micro), Pinecone-backed RAG, a FastAPI backend on AWS Lambda, a Vue.js/Nuxt frontend, and Terraform-managed infrastructure. Because Scout serves students, I also designed Bedrock guardrails for K-12 appropriate content, and built prompt-routing and context-trimming strategies that keep a small, fast model reliable. I am now leading Scout's migration from a buffered Lambda/API Gateway setup to a streaming endpoint, with time to first token as the primary performance target.

Before Scout, I was Lead Developer at Workroom.build, where I led a multinational team building a generative AI proof of concept: a multi-model agent for complex task automation, built with LangChain, FastAPI, Next.js and OpenAI, and I ran product discovery sessions to identify market opportunities. Earlier, as Tech Lead at Groupshop, I owned the delivery of a custom Shopify application (NestJS, GraphQL, TypeORM, React), mentored developers through structured code reviews, and used test-driven development to cut production errors by 15%.

What I bring to a team:

- **Production Gen AI, not just prototypes:** I built Scout for Studies Weekly Online end to end, including RAG over curriculum content with Pinecone, a LangGraph agent on Amazon Bedrock, K-12 safety guardrails, a serverless FastAPI backend on AWS

Lambda, a Vue.js/Nuxt interface, and Terraform-managed infrastructure, which I am now moving to real-time streaming responses.

- **Full-stack range:** I can ship the model layer, the API, the cloud infrastructure and the UI, so features reach users without handoff gaps.
- **Technical leadership:** I'm a Certified Scrum Product Owner who can turn business requirements into a backlog, lead sprint ceremonies, and mentor other engineers.

I would welcome the chance to discuss how I can contribute to your team. Thank you for your time and consideration.

Sincerely,

Sadaf Siddiqui

Scout (Studies Weekly Online): stack and infrastructure

Scout is a serverless, retrieval-augmented AI assistant for a K-12 curriculum platform, built on AWS with Bedrock models, LangGraph agents and a Nuxt frontend.

Layer	Technology	What I did with it
LLM	Amazon Bedrock, Nova Micro	Tuned system prompts with lexical trigger-word routing and a short-query default so a small model stays predictable
Safety	Bedrock Guardrails	Built K-12 content filtering; versioned each guardrail change in Terraform and logged incidents with CloudWatch invocation data
Agent orchestration	LangGraph	Tool-calling agent flow with context trimming to prevent instruction drift across turns
Retrieval (RAG)	Pinecone	Vector retrieval for curriculum content, plus an ingestion CLI

Layer	Technology	What I did with it
Backend	FastAPI on AWS Lambda	Single Lambda behind multi-route API Gateway; moving to Lambda Function URLs with the Lambda Web Adapter
Streaming	Bedrock converse_stream, LangGraph astream_events	Token streaming end to end, replacing buffered responses
Data	MongoDB, DynamoDB	Application data in MongoDB; DynamoDB schema designed for the streaming architecture
Frontend	Vue.js, Nuxt	Chat UI, plus DOM awareness: a Nuxt plugin that collects page breadcrumbs and buttons, and a tool that highlights UI elements for the user
Infrastructure as code	Terraform	API Gateway routes, Lambda, guardrail versions, and modules with decommission manifests for legacy Lambdas
Observability	CloudWatch	Metrics and logs, with time to first token as the primary service-level target
Local development	DynamoDB Local, a Bedrock emulator	Scenario-based fake Bedrock responses so the team can test without cloud calls

Skills set

- **Generative AI and LLMs:** RAG pipelines, prompt engineering and model optimisation, multi-model agents, GPT-4o, Gemini, DeepSeek R1, Amazon Bedrock (Nova Micro), guardrails and content safety
- **Agentic frameworks:** LangGraph, LangChain, CrewAI, tool calling, streaming agent responses
- **Vector databases:** Pinecone, PGVector, FAISS

- **Backend and APIs:** Python, FastAPI, Node.js, NestJS, GraphQL, REST, TypeScript
- **Frontend:** Vue.js, Nuxt, React, Next.js, JavaScript, TypeScript
- **Cloud and infrastructure:** AWS Lambda, API Gateway, Lambda Function URLs, DynamoDB, CloudWatch, Amazon Bedrock, GCP, Terraform (infrastructure as code), serverless architecture
- **Databases:** MongoDB, PostgreSQL, MySQL, DynamoDB
- **Engineering practice:** CI/CD with Jenkins, Git, GitHub and GitLab, test-driven development, code review, observability and performance targets
- **Leadership and product:** Certified Scrum Product Owner (CSPO), agile ceremonies, backlog ownership, stakeholder management, mentoring
